*You're invited*

Whether you are a \$500M company or a Fortune 100 enterprise, the cost of protecting and recovering your key applications is becoming exorbitant. These costs include hot-site subscription costs, declaration fees, and daily usage - not to mention the labor and network costs. Organizations are now able to use the benefits of virtualization, high availability and bare metal restore technologies to protect the servers in a network. How well do you understand these technologies?

This webcast will provide valuable insight on how an IT recovery solution can help provide enterprise-caliber rapid restore times and data synchronization without enterprise-caliber costs. Specific topics will include:

- Choosing the right mitigation strategy for your organization
- Ideal characteristics of a disaster recovery solution
- Data protection options
- Technical challenges you may face and strategies to avoid the pitfalls

Join Damian Walch, Director in Deloitte & Touche LLP's Enterprise Risk Services practice, in person or online for this informative session. If attending in person, be sure to join the lunch reception following the webcast and network with Deloitte practitioners and CyLab researchers.

We look forward to your attendance on May 27, 2008.
